

Current Status -

The site was proposed to the NPL list in the *Federal Register* on March 8, 2004. The EPA established a public comment period and will make a final listing decision after considering the relevant comments if the site continues to meet the requirements for listing.

Benefits -

The identification of the site for the NPL is intended to guide the EPA in:

 determining which sites warrant further investigation to assess the nature and extent of the human health and environmental risks associated with a site.

National Priorities Listing (NPL) History

Proposed Date: March 8, 2004 Final Date: Pending

Location:

- Devil's Swamp consists of a large flood plain area near Scotlandville, East Baton Rouge Parish, Louisiana, about ten miles north of the City of Baton Rouge.
- Devil's Swamp is also a freshwater wetland covering approximately 31 square kilometers (12 square miles) of land along the Mississippi River.
- Within the swamp, the "Oxbow" or "U" shaped <u>Devil's Swamp Lake</u> is approximately 0.75 miles (4,200 feet) in length, 1/12 miles (400 feet) wide, some 20 feet deep at its deepest parts, and covers approximately 64 acres.
- Devil's Swamp Lake is characterized as a man-made lake, resulting from the construction of Baton Rouge harbor in 1973.

Population:

- City of Baton Rouge (population 602,894 in 2002)(Metro statistical area).
- Parish of East Baton Rouge (population 412,952 in 2000)(U.S. Census Bureau).
- Major residential areas include Scotlandville, and residential communities along Highway 61,
 Scenic Highway, east of Devil's Swamp. This includes the Alsen Community.

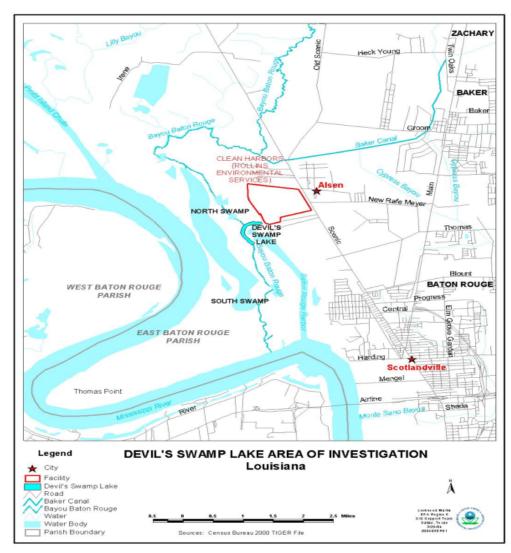

Setting:

- Industrial facilities have discharged to the swamp since the 1960's and the 1970's.
- The swamp to the north of the lake is characterized by numerous small open ponds and water tupelo trees. This 262-acre area extends approximately1.0 miles (5,500 feet) to the Devil's Swamp Lake.
- The swamp to the south of the lake is characterized also by numerous small open ponds and water tupelo trees. This 684-acre area extends approximately 2.2 miles (11,500 feet) to the Mississippi River and is subject to frequent backwater encroachment from the river.

Principal Pollutants:

- Sampling conducted by the State in 1980's identified the presence of Polychlorinated biphenyls (PCBs) in the lake and in a drainage ditch or outfall canal leading to the former Rollins facility.
 PCBs are a category or family of chemical compounds.
- Concentrations of PCBs have been observed in several samples collected by the EPA during a 1993 Expanded Site Inspection. Some samples show concentrations of PCBs congeners of up to 5.2 mg/kg of Aroclor-1248, 6.4 mg/kg of Aroclor-1254 and 1.6 mg/kg of Aroclor-1260. Congeners are well-defined chemical compounds in the PCB category.
- The extent of contamination and volume of contamination have not been established

Site Map

Human Health Considerations

- Several Preliminary Assessments and Site Inspections were completed by the EPA. More recently, in 1995, the EPA completed a Screening Level Risk Assessment (SLRA). This screening report indicated a potential for adverse risk.
- Based on the limited information available in 1995, it appears that contaminants could be posing
 adverse effects to biota utilizing the site, thus, the EPA initiated a comprehensive risk assessment
 to further collect more information, evaluate the site and the potential risk.
- In 1997, the EPA conducted sampling activities during high and low flow conditions. Data collected was analyzed and validated in 1998.
- A Human Health Risk Assessment and an Ecological Risk Assessment were completed in early 1999 by the EPA.
- The Human Health and Ecological Risk Assessments have shown that concentrations of PCBs can produce unacceptable risks to human health and the environment.
